IN THE CLAIMS

- 1.-21. (Cancelled)
- 22. (Currently Amended) An A transfer coatable, removable or repositionable aqueous adhesive composition comprising:
 - (a) from about 5 to about 75 weight % of an aqueous suspension of polymeric acrylate microspheres;
 - (b) from about 25 to about 95 weight % of an aqueous emulsion of crosslinked acrylate polymer; and optionally,
 - (c) a functionally effective amount of one or more auxiliary ingredients for modifying coating or enhancing adhesive performance properties;
 - wherein the weight ratio, on a solids basis, of microspheres to crosslinked acrylate polymer is about 0.025:1 to about 1.9:1, and;
 - wherein said polymeric acrylate microspheres are solid, and are produced by the process comprising: A) contacting a polymerizable aqueous emulsion of at least one non-ionic monomer of an alkyl acrylate or alkyl methacrylate ester of a non-tertiary alcohol and at least one ionic monomer copolymerizable with said non-ionic monomer and at least one non-free radically polymerizable acid; and B) polymerizing the emulsion to form an aqueous suspension of said solid polymeric pressure sensitive adhesive microspheres; wherein said non-free radically polymerizable acid is contacted with said polymerizable aqueous emulsion prior to achieving about 95% conversion of said non-ionic monomer.
 - 23. (Cancelled).
- 24. (Previously Presented) The composition of claim 22, having dry film peel value of about 0.2 to about 2.5 pounds per inch peel force on stainless steel with adhesive failure mode.
 - 25.-26. (Cancelled).

- 27. (Previously Presented) An article comprising a face stock material having coated thereon a removable or repositionable, pressure sensitive adhesive composition which is transfer coatable comprising: (a) solid polymeric acrylate microspheres, (b) crosslinked acrylate polymer, and, optionally, (c) a functionally effective amount of one or more auxiliary ingredients for modifying coating or enhancing adhesive performance properties; wherein the weight ratio of microspheres to crosslinked acrylate polymer is about 0.025:1 to about 1.9:1, and wherein said solid polymeric acrylate microspheres are produced by the process comprising: A) contacting a polymerizable aqueous emulsion of at least one non-ionic monomer of an alkyl acrylate or alkyl methacrylate ester of a nontertiary alcohol and at least one ionic monomer copolymerizable with said non-ionic monomer and at least one non-free radically polymerizable acid; and B) polymerizing the emulsion to form an aqueous suspension of said solid polymeric pressure sensitive adhesive microspheres; wherein said non-free radically polymerizable acid is contacted with said polymerizable aqueous emulsion prior to achieving about 95% conversion of said non-ionic monomer.
 - 28. (Cancelled).
- 29. (Original) The article of claim 27 having dry film peel value of about 0.2 to about 2.5 pounds per inch peel force on stainless steel with adhesive failure mode.
 - 30.-31. (Cancelled).
